The penalty number has no physical significance and is chosen based on computational convenience. Values P that are two to four orders of magnitude greater than the shear modulus of the adjacent medium were used and provided solutions in which incompatibilities were extremely small. Larger values of P sometimes of gave numerical difficulties due to ill-conditioning while smaller values gave slightly excessive incompatibility. $P (4)$ It is assumed this research that the amount of tangential sliding is small enough so that the asperity peak one surface does not override that of the other surface. For situations in which this is not the case, the theory can be supplemented with an additional set of conditions as discussed in reference 7. COMPLIANCE MAT IX R of be solved to demonstrate the significance of friction and tortuosity is shown in figure The singular integral equations that govern this problem are where is the far-field shear stress, ut and On are the shear T-and normal stresses applied to the crack surfaces, G is the shear modulus, $3- v k 4$ for plane strain, being Poisson's ratio, and $f (t)$ and $e (t)$ are the dislocation densities, which are related to the crack sliding and crack opening displacements by $1 t l u x f (t) dt gt- ui 1-t g n e (t) dt-uY l, uY$ Because the crack is closed at the endpoints the dislocation densities must satisfy the following conditions Since ut and an depend on the relative displacements between the...
